GEN series CTS400ID applications

The HBM series of current transducers feature industry standard, fluxgate, closed-loop technology. The second harmonic zero flux detection ensures the highest accuracy and lowest drift while maintaining a high bandwidth. HBM current transducers are perfect for measuring currents between 10 and 1000 A RMS. With the high bandwidth support, they can be used with fast rise time signals, such as those found in electric drives or other inverter applications, such as those in renewable industries.

The CT series is available for 50 A RMS to 1200 A RMS, all sharing the same high-end technology. All connectors are compatible for fast exchange.

The optional 1 HE 19" rack mountable power supply can power any mix of up to six CTs. Current output cables to connect directly to the GN31XB power card, as well as to the GN61XB card, are available.

Optional burden resistors are available for the GEN series Data Acquisition Systems or power analyzers without an integrated burden resistor.

The advanced sensor protection circuit ASPC prevents sensor damage for incorrect use cases, such as currents applied to unpowered CTs or powered CTs without a burden resistor to close the current output loop.

Burden selection for GN610B/GN611B

Note: When using the CTS/CTM series together with GN610B/GN611B cards a burden resistor is required to convert the CT output current to a voltage. When selecting the burden several specifications need to be taken into account: maximum power of the burden, maximum voltage the CT can drive with constant current, the wire impedance of the cables used etc. See the CT operating manual for more details.
