1) Each type of irregular stress (bending moment, lateral or longitudinal force, exceeding nominal (rated) torque) can only be allowed up to its specified limit, provided none of the others can occur at the same time. If this condition is not met, the limit values must be reduced. If 30% of the bending moment limit and lateral limit force occur at the same time, only 40% of the axial limit force is allowed and the nominal (rated) torque must not be exceeded. The effects of 10% of the allowed bending moments, axial and lateral forces on the measurement result are $\leq \pm 0.02\%$ of the nominal (rated) torque
