4) Mechanical stress is tested according to European Standard EN60068-2-6 for vibrations and EN60068-2-27 for shock. The equipment is subjected to an acceleration of 50 m/s^2 in a frequency range of 5...65 Hz in all 3 axes. Duration of this vibration test: 30min per axis. The shock test is performed with a nominal acceleration of 350 m/s^2 for 6 ms, half sine pulse shape, with 3 shocks in each of the 6 possible directions.

5) The DC voltage supply must meet the requirements of IEC 60950-1 on a SELV voltage supply.

6) Due to the higher zero error, the accuracy class of half bridge strain gages is 0.5. The more important linearity deviation remains < 0.02%.

7) When using a half bridge, the shunt resistor may only be used when signals 1 (Pin 6) and 4 (Pin 7) are bridged (in this case, control signal: typ. + 0.873 mV/V at 350 Ω).

[8] Due to the higher zero error, the accuracy class of half bridge strain gages is 0.2. The more important linearity deviation remains < 0.02%.
[9] When using a half bridge, the shunt resistor may only be used when signals 1 (Pin 6) and 4 (Pin 7) are bridged (in this case, control signal: typ. + 0.873 mV/V at 350 Ω).
[10] A higher transducer impedance is possible (< 5000 Ω). This merely results in a higher zero error and thus an accuracy class of 0.3.

[12] Accuracy class focusses on linearity. Zero point deviation is 0.5% of range.
