

Webinar

“Three ways to optimize your production with IOT”

Michael Guckes

- **Product Manager Industrial Measurement Solutions**
- Product manager for industrial amplifiers and software
- Graduate engineer
- 20 years of experience in factory automation
- **E-Mail:** michael.guckes@hbm.com

Michael Guckes

Overview:

- IT, OT, IoT, Cloud and Industry 4.0 – What is this?
- What are the benefits of Industry 4.0?
- Cloud, edge and fog computing
- Industry software protocols
 - OPC UA, REST
 - Practical application

IT:

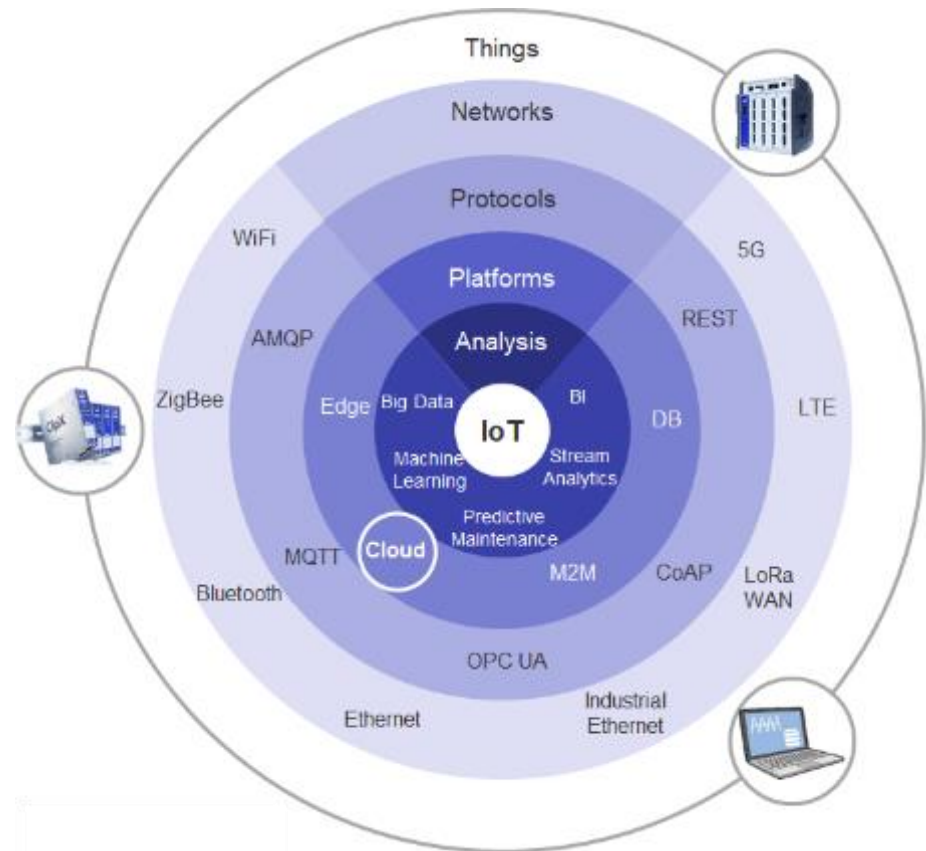

- Spectrum of technologies for data processing
- Does not include embedded technology

OT:

- Gartner: OT is hardware and software that detects or causes a change by directly monitoring and / or controlling physical devices, processes, and events in the enterprise.

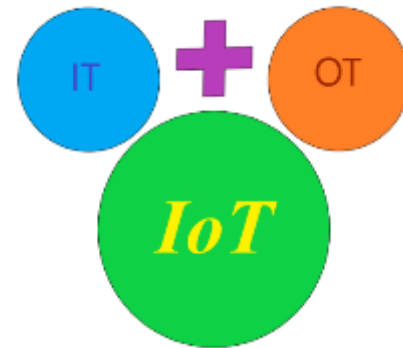

- Merging of IT and OT
- Integration of 'things' in the communication flow of the internet
- Industrial part: IIoT
(Industrial Internet of Things)

IoT – Just a temporary trend?

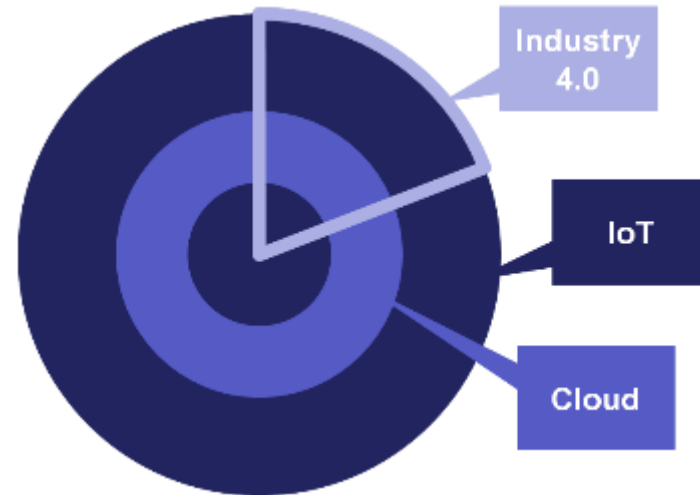

- Analysts see IoT on an unchecked growth path
- Market share is expected to grow to over \$ 23 billion by 2020
- By 2020 there will be an estimated 20.4 billion networked devices

- Central processing of data
- Scalable computing power
- Big data
- Low cost
- Efficient
- Easy data storage and analysis

- Industrie 4.0 is only one part of Cloud and IoT
- Provides benefits:
 - Asset services
 - Predictive maintenance
 - Device management

What are the benefits of industry 4.0?

**Asset
Services**

**Predictive
Maintenance**

**Device
Management**

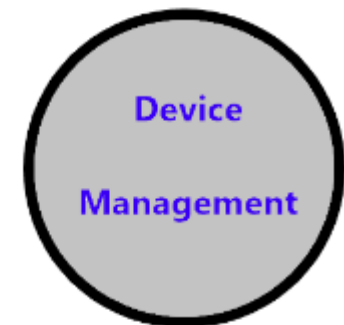

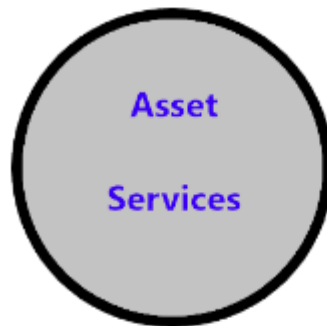

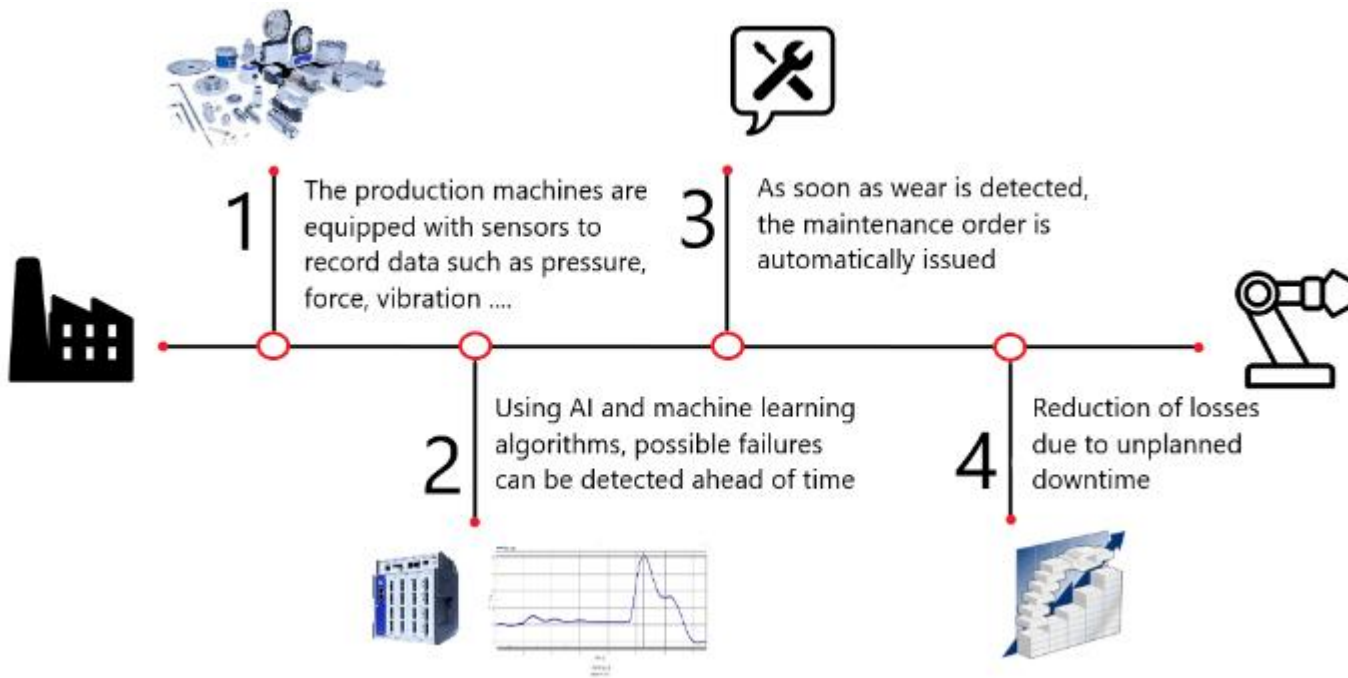

- Monitoring the production line
- Automatic reactions of the machines
- Real time processing

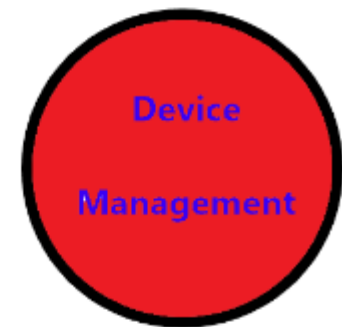

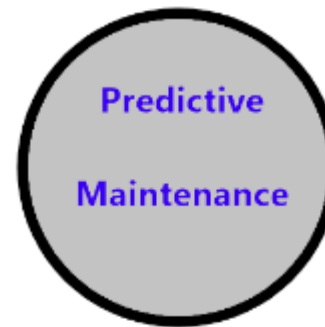

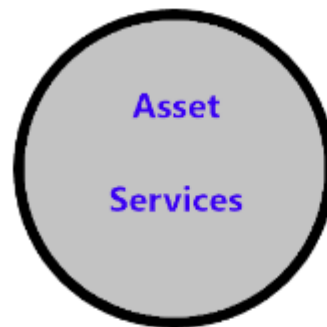

- Production optimization
- Avoid unplanned downtime
- Increasing production security and continuity
- Prediction and automatic scheduling of maintenance

- Access from anywhere
- Create a secure and solid infrastructure
- Retrofit existing systems with Industry 4.0 components

How can you benefit from it?

User...

- Save time and money by avoiding downtimes
- Get greater transparency of production processes
- Benefit from:
 - increased productivity
 - optimized production processes
 - increased product quality

- By 2025, the total amount of data will increase from 23 zettabytes (2017) to 175 zettabytes
 - Cloud offers appropriate storage capacities
- Analysis of this amount of data requires a lot of computing power
 - Cloud offers scalable computing power

However...

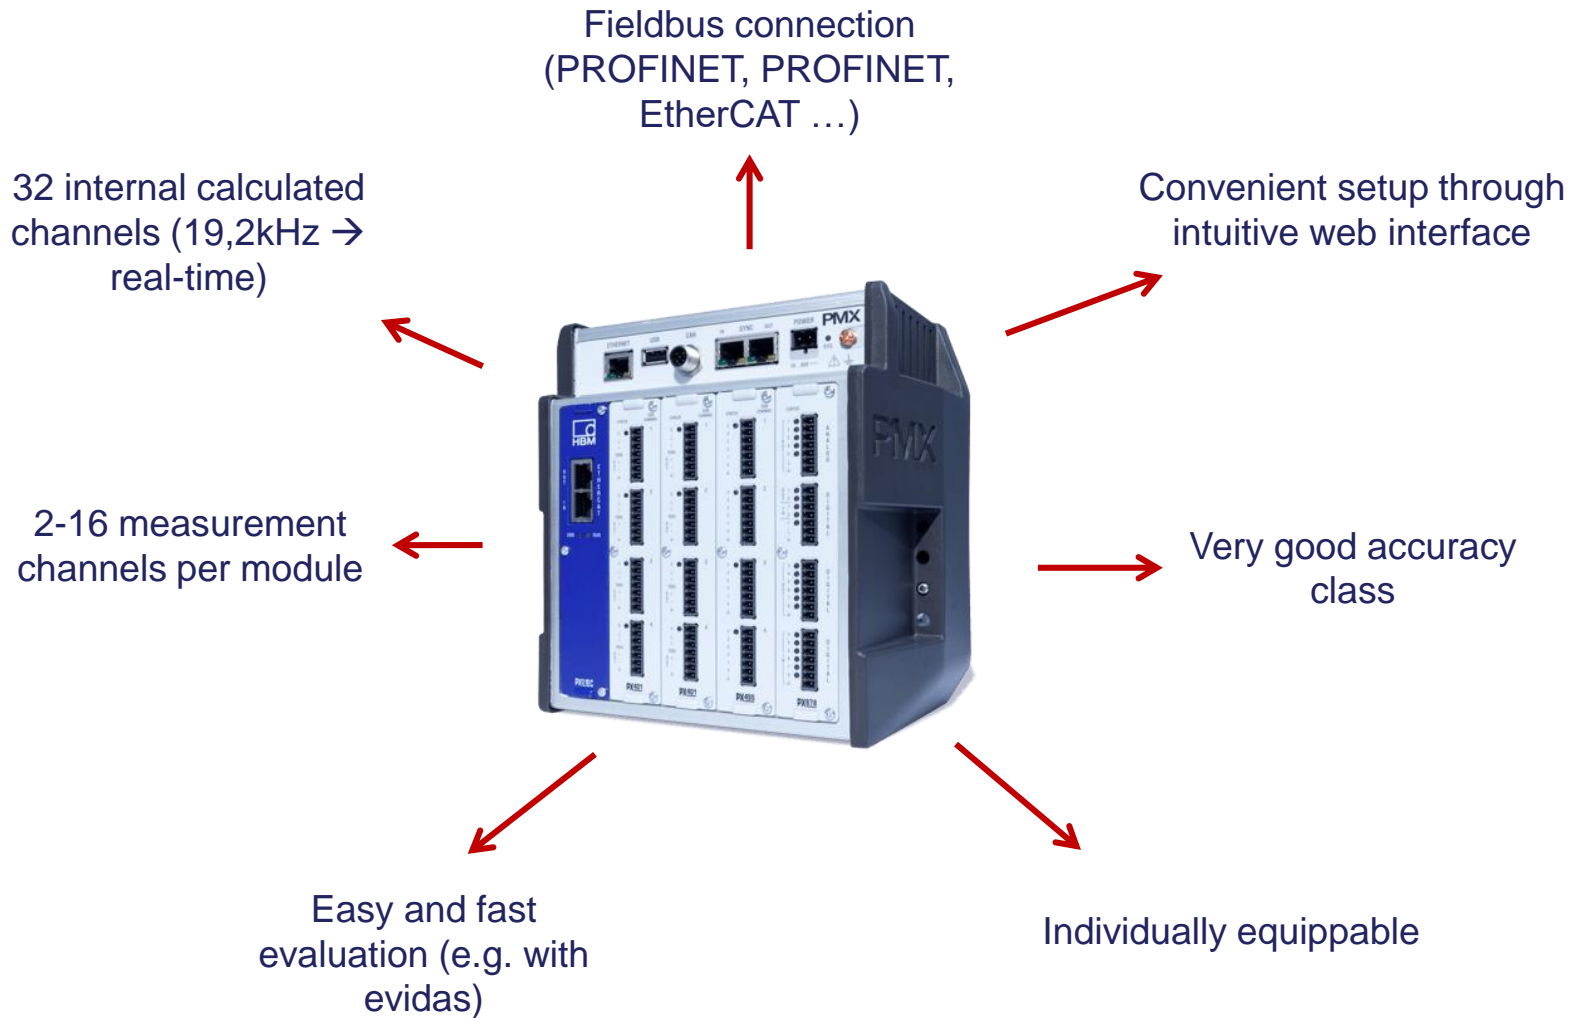

However...

- Cloud has no real-time capability (In 2025, the proportion of real-time data is estimated at 30%)
 - Latency in processes that require fast reactions is too high
- Security concerns
 - Sensitive data must be protected

Solution?

- Edge Computing = decentral processing of the data at the edge of the network
 - „Analytics on the Edge“
- Remarkably low latencies → Real-time processing
- Processing data from sources that can not be transferred to the cloud for cost or technology reasons
- Fast and easy algorithms

The right mixture is the key – Fog Computing

- A solution consisting of both components is purposeful
 - Processing of real-time data at the periphery of the network
 - Also reduces the data load on the internet
 - Storing historical, unresponsive data in the cloud
 - Trend analysis is carried out in powerful centers

- Which standards are there?
 - OPC UA – Open Platform Communications Unified Architecture
 - REST – Representational State Transfer
 - MQTT – Message Queuing Telemetry Transport
 - DDS – Data Distribution Service
 - AMQP – Advanced Message Queuing Protocol
 - ...

→ In Europe, OPC UA is considered the most dominant protocol

- Server \leftrightarrow Client principle
- More primitive structure
- Data is sent to HTTP servers at fixed intervals (always Value / Max / Min / Mean)
- Client must know the server name
- No communication Server \rightarrow Client

REST
Representational State Transfer Protocol

Properties of OPC UA

- OPC UA is a standardized, platform-independent software interface
- Minimal software development and maintenance effort
- Powerful, user-friendly and flexible
- Multiple access possible
- Safe → User rights
- Server ↔ Client principle

- OPC UA covers a large area of the Industry 4.0 Reference Architecture Model (RAMI 4.0)

OPC UA with ClipX

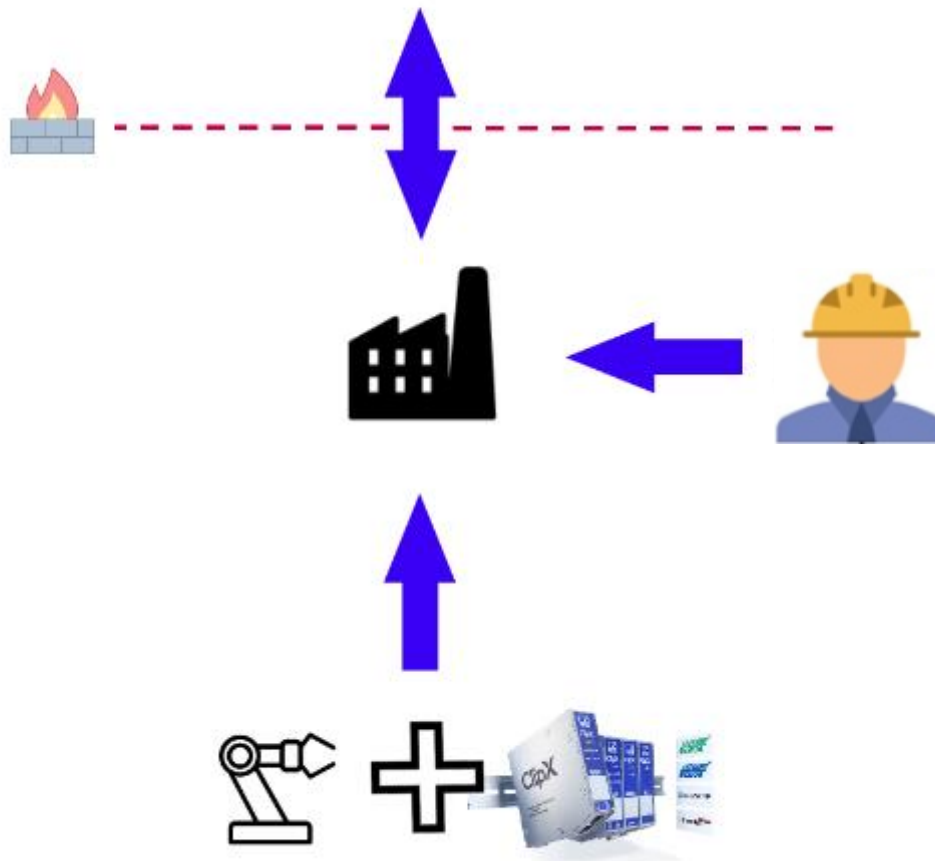

- With the firmware 2.0 HBM's ClipX is OPC UA capable
- Easy connection via Ethernet in the network (wireless or by cable)

Practical example: ClipX with OPC UA and REST

  **BOSCH**
Microsoft Azure HBM Cloud Bosch Production
Performance Monitor

Live-Demo available around the world (max. 2 connections)

ClipX live on the internet: <http://clipxdemo2.hbm.com>

Live demo available around the world (max. 2 connections)

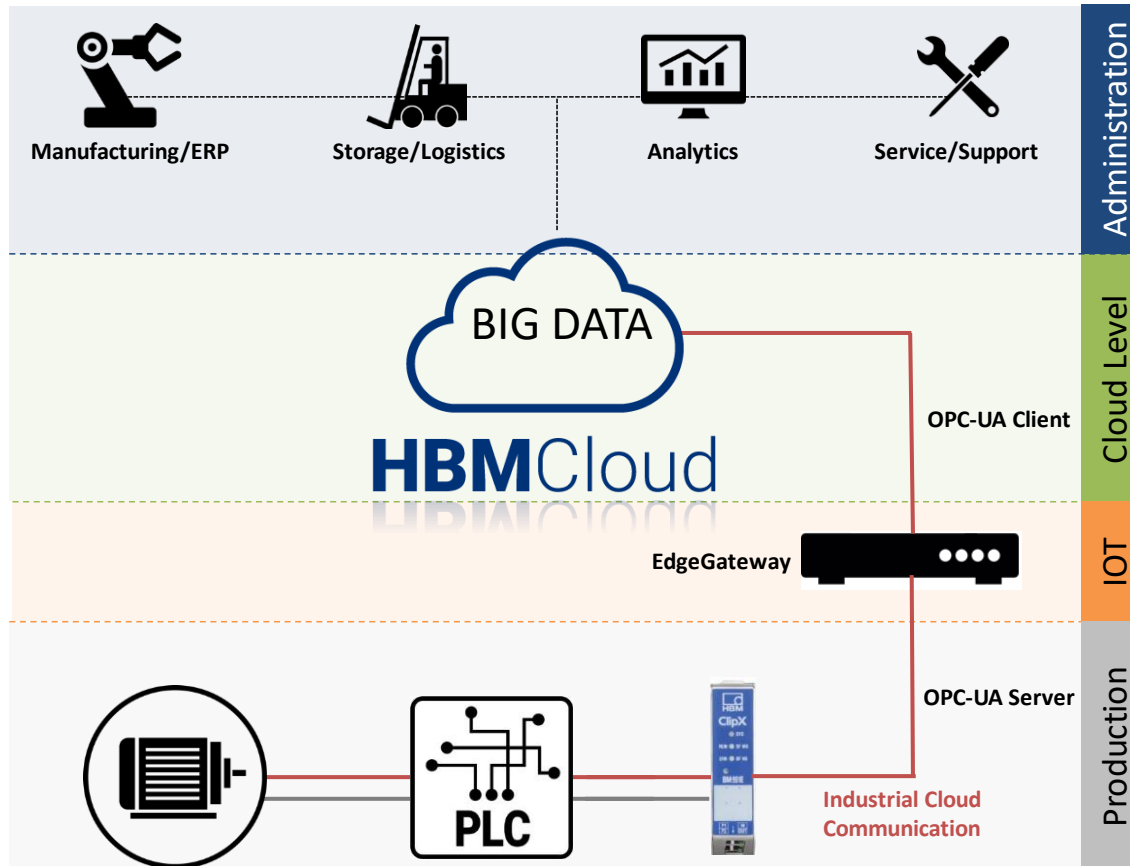

The screenshot shows the ClipX web server interface. It features three main data panels: 'Electrical Value' showing a field value of -0.350 V, 'Gross' showing a value of -166.0810000 N, and 'Net' showing a value of -155.151 N. Below these are configuration sections for 'Sensor Type' (Voltage +/-10V), 'Physical Unit' (N), 'Filter Type' (Bessel), 'Cut-off Frequency' (100 Hz), and 'Scaling Type' (Two-point scaling) with two measurement points.

Ethernet connection with ClipX web server

The screenshot shows the ClipX OPC client interface. It includes a 'Browser' tree on the left with nodes like 'ADC value', 'Gross value', and 'Net value'. A 'Node Properties' panel on the right shows details for 'Gross value', including NodeId (ns=1::103), Node Class (Variable), and a current Value of 226.1878. At the bottom, a 'Visualization' section displays a line graph of 'Gross value' over time, with a 'Start logging' button.

OPC-UA connection with ClipX OPC client

- Easy integration of ClipX in IoT infrastructures and the cloud

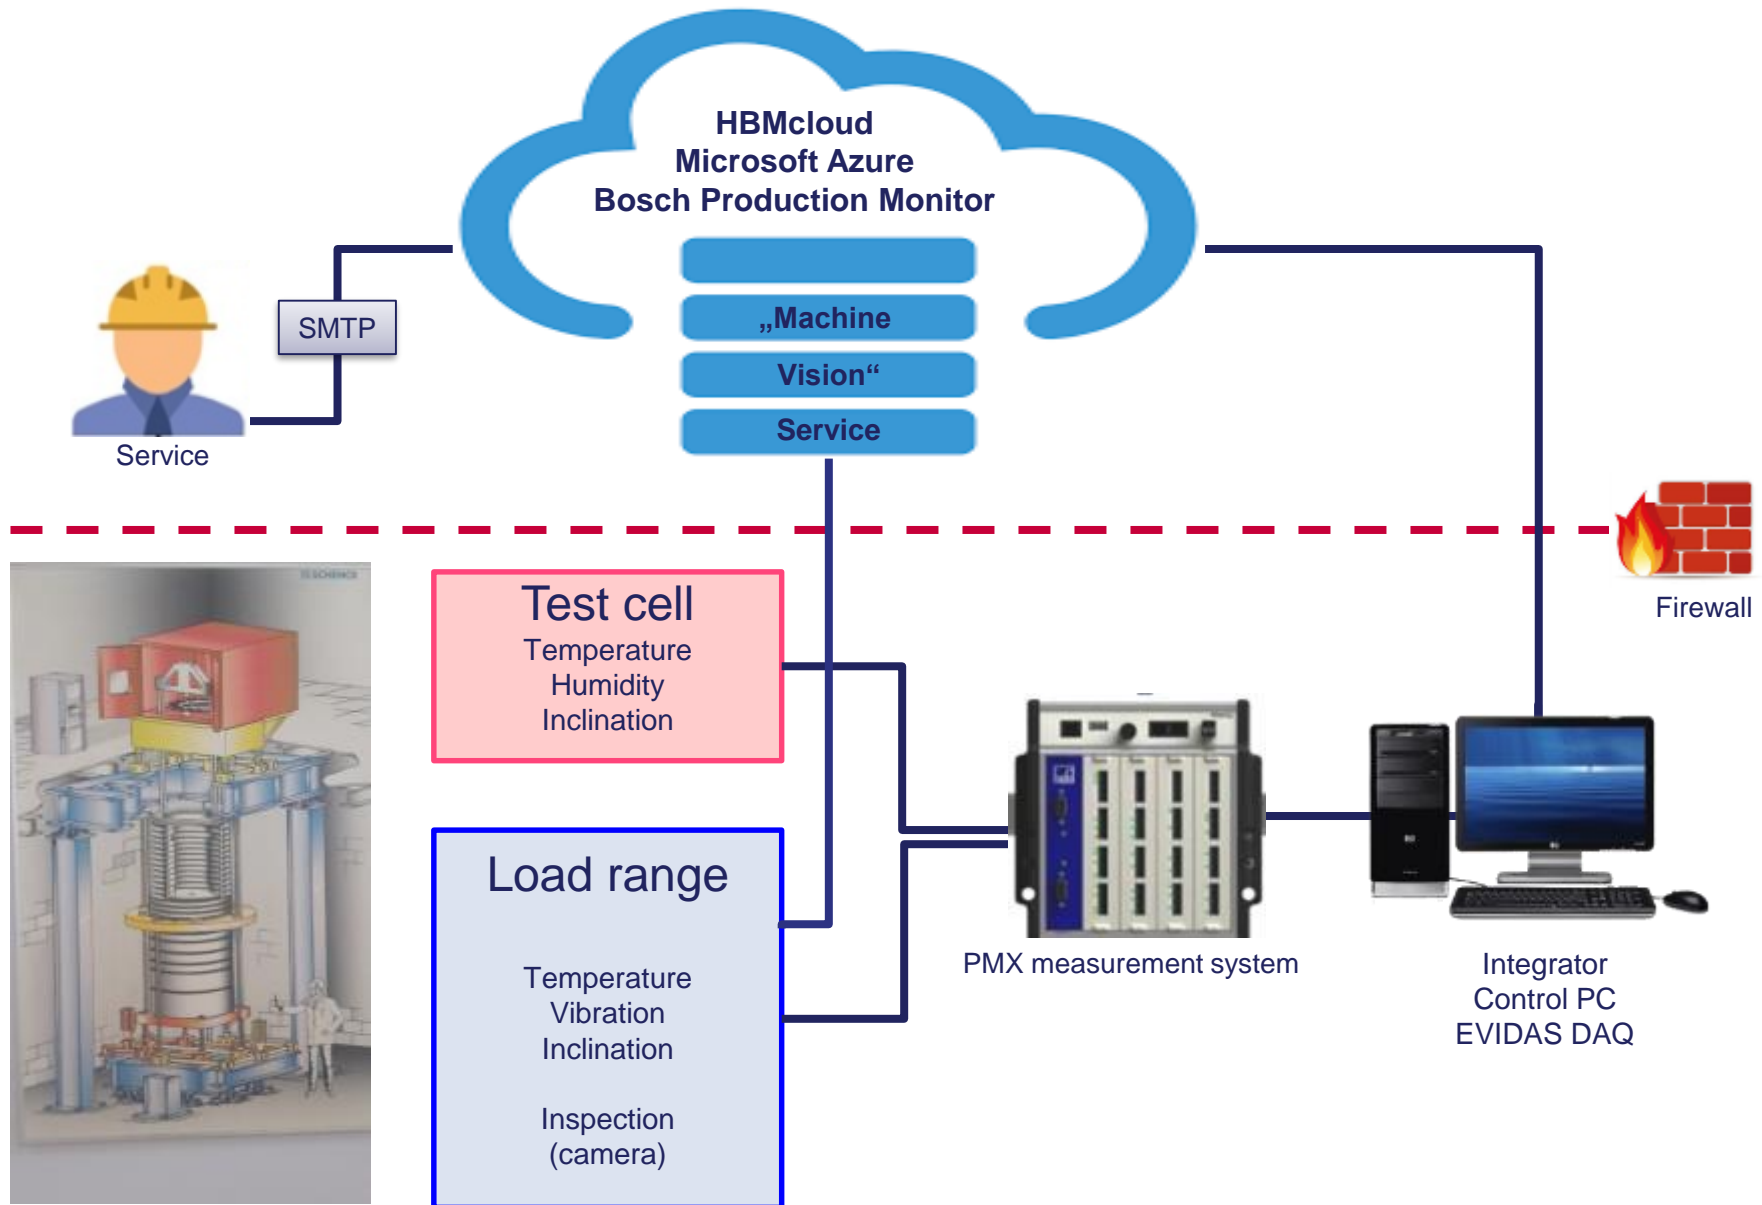

- Sensor calibration
- Calibration station with test chamber

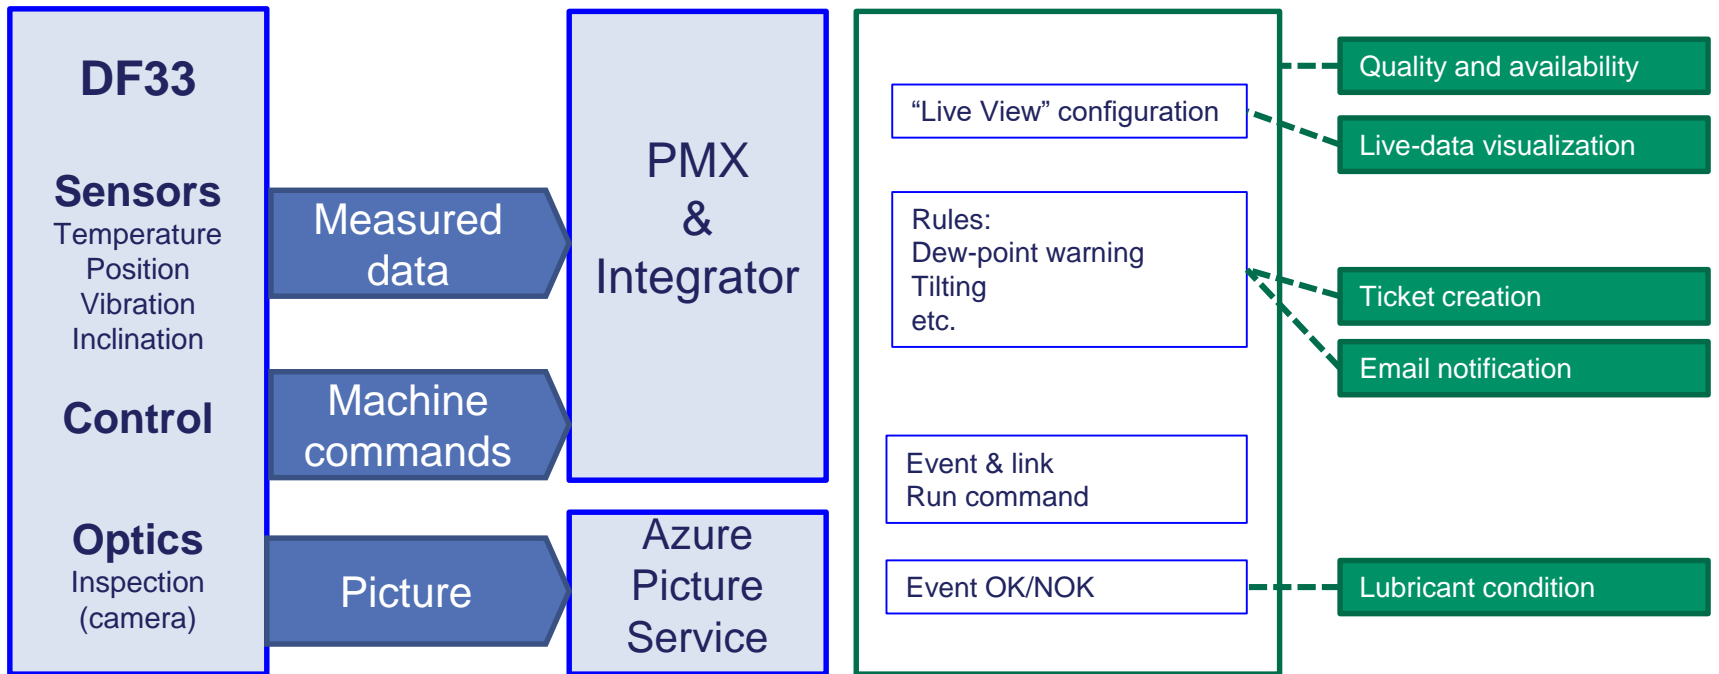

- Load space with deadweight system

HBM test bench - signal and data flow diagram

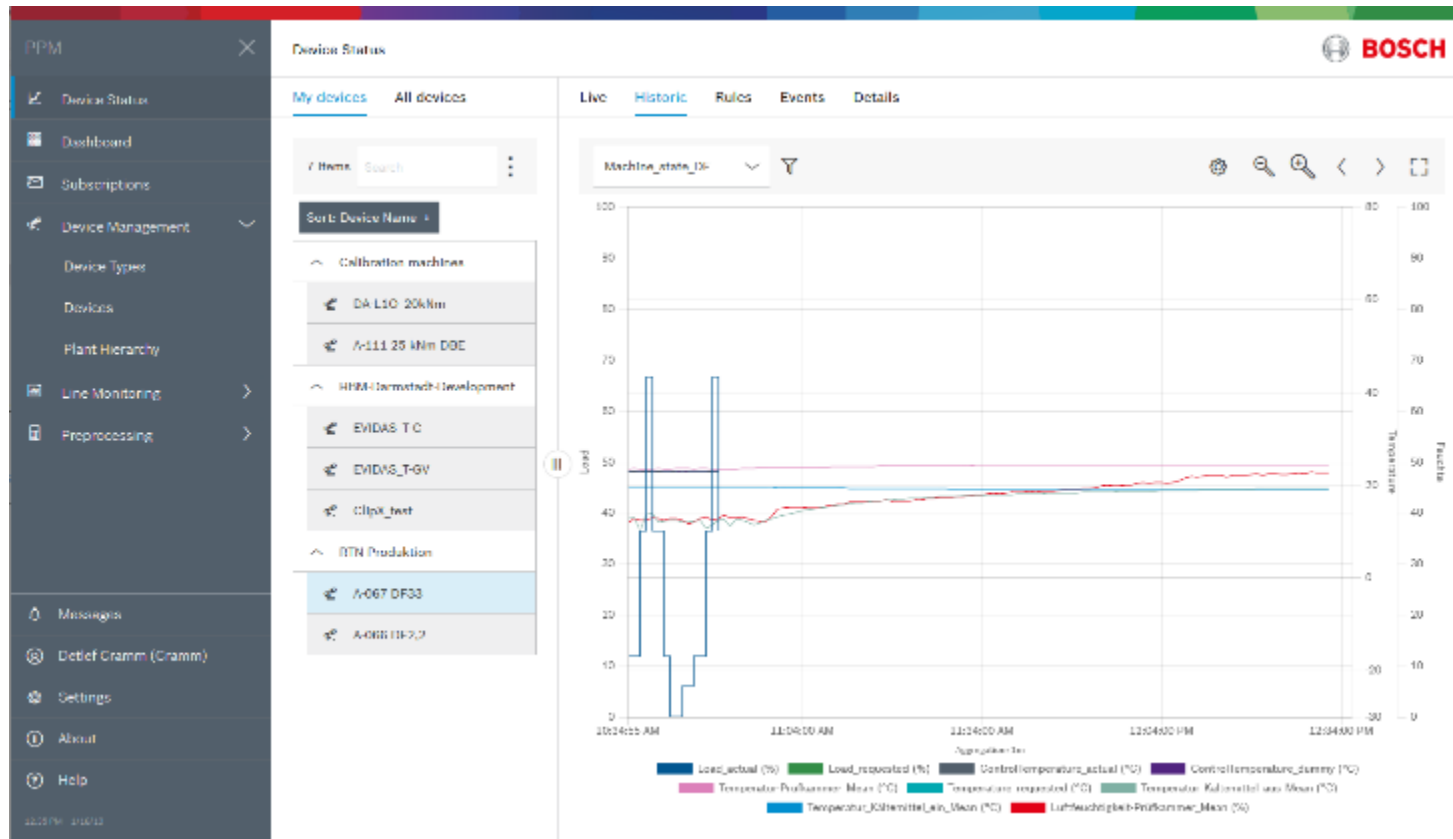

Engine room

Bosch Production Monitor

Innovation gain

BPM Link:

OPC-UA application with PMX and ClipX (Process Control)

Integration of monitoring data into IOT-software like Bosch Production Performance Manager (PPM)
Based on standard Ethernet connections ([Infolink](#))

- PMX - via IOT-Hub like EVIDAS
- ClipX - direct via IOT-Protocol (Rest, Bosch)

More information on IOT can be found on our website:

Test and measurement technology meets Industry 4.0

Enhanced flexibility, higher speed and increased efficiency in the production process are the objectives pursued by forward-thinking companies. The vision of networking man and machine with other objects is the central pillar in this context and is quickly becoming a reality. 'Industry 4.0' is the name the vision is known by.

Only through the use of cutting-edge "Test and measurement technology 4.0" can this vision of a networked production of the future become reality. Since the more complex and dynamic the processes in the manufacturing companies throughout the world, the more important becomes the availability of real-time data on critical parameters.

"Test and Measurement Technology 4.0": What Does That Actually Mean?

- **Sensors** that allow for easy and fast integration with complex production systems - for example through availability of "electronic data sheets"
- **Measuring amplifiers** that can communicate in real time with sensors and today's Industrial Internet systems
- **Test and measurement software** that bridges the gap between easiest possible handling and increasingly complex functionality

"We Learn About Industry 4.0 and What it Means for Test and Measurement Technology"

"HBM, as a test and measurement partner in the industry, is proud to be able to contribute to the success of Industry 4.0. In joint projects with universities we learn what Industry 4.0

means in practice for test and measurement technology. Our innovative products for use in manufacturing are proof that we have many ideas for making Industry 4.0 a reality."
